TMS

TERMINAL MANAGEMENT SYSTEM

A Complete ERP for Oil Storage Terminal Operations — Mogas & Condensate

One Platform. Every Terminal Operation.

A purpose-built digital nervous system for oil storage terminals

End-to-End ERP

From vessel planning to invoicing — every terminal process is digitized, tracked and auditable.

Dual Product Handling

Purpose-built for Mogas and Condensate, with product-specific rules, tanks and calculations.

Three Connected Portals

OMC, Security and Terminal portals work together in real time with role-based access.

Data-Driven Decisions

Live dashboards for stock, losses and reconciliation empower faster, informed decisions.

TMS replaces scattered registers, manual dips and offline approvals with one connected, auditable system — purpose-built for the realities of terminal operations.

Built for Two Critical Products

Mogas and Condensate, each with dedicated calculation logic

MOGAS

AUTOMATIC VOLUME CORRECTION

85°F Litres

Every tank level automatically calculates volumes corrected to 85°F, alongside natural (observed) litres — eliminating manual conversion errors during loading.

CONDENSATE

AUTOMATIC VOLUME CORRECTION

15°C Litres

Every tank level automatically calculates volumes corrected to 15°C, alongside natural (observed) litres — ensuring standardized, dispute-free custody transfer.

Three Portals, One Connected Workflow

Every stakeholder works from the same live data

OMC Portal

Oil Marketing Companies plan loading & decanting: vessel plans, lorry nominations, driver details and quantities.

Security Portal

Real-time gate-in / gate-out notifications with bilingual (English & Urdu) inspection checklists.

Terminal Portal

Role-based access for operations, custody, and management — gate passes, readings, approvals & reports.

Mogas Workflow: From Vessel Plan to Exbond

A fully system-tracked custody chain

1

Vessel Plan

OMC plans the vessel; terminal allocates tanks

2

System JDS

Auto-generated Joint Delivery Statement, ready for sign-off

3

Customs Process

Customs formalities recorded and tracked in software

4

NOC Clearance

Quantity held as Terminal stock until NOC is cleared

5

Terminal Inbond

Cleared quantity moves to Inbond status

6

OMC Exbond

OMC plans Exbond for a specific quantity to begin loading

The Loading Process, Step by Step

Coordinated across OMC, Terminal and Security in real time

1. Loading Plan	OMC nominates lorries, drivers & quantities — in natural and 85°F litres — via the OMC portal
2. Gate Arrival	Operations Incharge raises a gate pass on lorry arrival and alerts Security
3. Security Check	Bilingual (English/Urdu) inspection checklist; lorry marked-in if compliant
4. Filling	Loading proceeds at the bay under the approved plan
5. Field Update	Operations Incharge records final readings & updates the gate pass
6. Gate Exit	Driver receives printed gate pass; Security verifies and marks lorry out

Condensate: Decanting & Loading, Both Ways

The same OMC can decant into, or load from, the terminal

DECANTING WORKFLOW

1. OMC plans decanting — lorry, driver & 15°C litre quantity — via the OMC portal
2. Operations Incharge issues a gate pass on arrival; Security gets a go-ahead notification
3. Security inspects and lets the lorry in once compliant
4. Decanting proceeds; Operations Incharge updates readings on the gate pass
5. Driver receives the printed gate pass; Security verifies and marks the lorry out

Two-Way by Design

Any OMC decanting Condensate can also load it whenever needed — the same tanks and workflow support both directions without duplicate setup.

On tank fill-up, the OMC plans vessel export for that Condensate — directly from the same system.

Complete Stock & Tank Intelligence

Precision monitoring across tanks, lines and temperature

Temperature-Specific Stock

Live stock monitoring at the correct product temperature — for tanks and for lines.

Line-to-OMC Mapping

Every line is defined against the OMC it serves, ensuring accurate allocation.

Intertank Transfer

Move product between tanks within the system, fully logged.

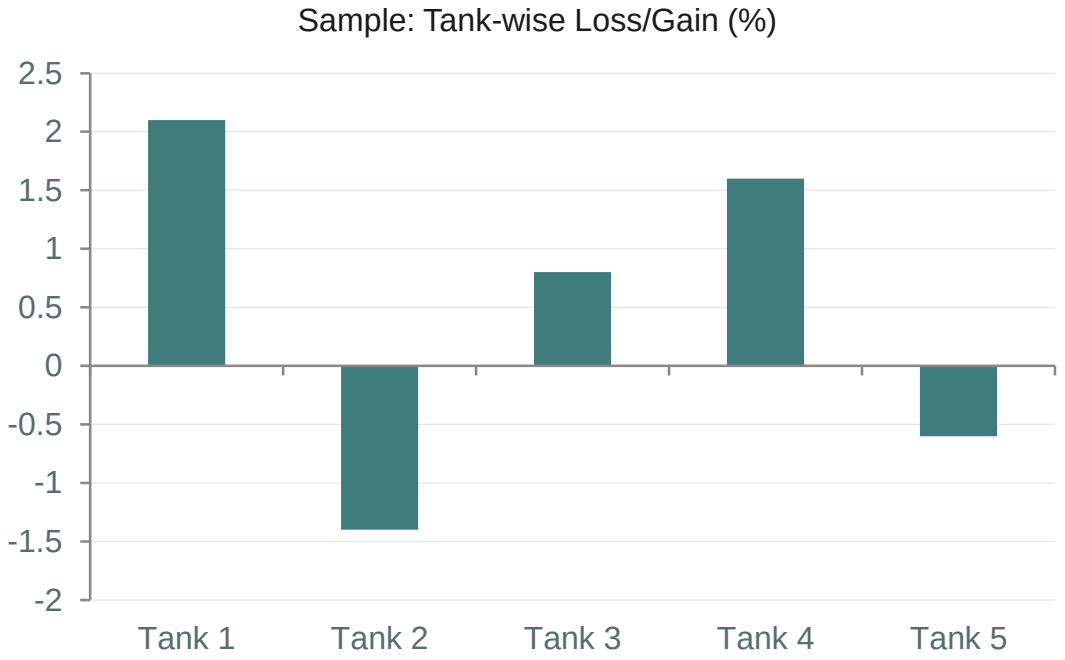

Swapping

Swap volumes OMC-to-OMC, tank-to-tank, or line-to-tank as operations require.

Loss & Gain, Measured Every Way That Matters

Actionable analytics for terminal operators

- Daily loss/gain calculation
- Shift-wise breakdown
- Tank-wise breakdown
- Overall terminal-wide totals
- Attractive, real-time dashboards for terminal operators

Every number is traceable — from tank dip to OMC reconciliation.

Month-End Reconciliation, Automated

Every OMC's stock and loss position, settled with confidence

Aggregate

System compiles each OMC's stock movements and losses across the month

Reconcile

Terminal and OMC positions are reconciled against system records

Certify

Reconciliation statements & certificates generated and signed off

Removing spreadsheets from month-end close eliminates disputes and accelerates sign-off between the terminal and every OMC.

Every Document, Generated On Demand

Reports, certificates and daily readings — always current

JDS & Certificates

Joint Delivery Statements and all official certificates system-generated

Daily Dips & Gauge Reports

Tank dips recorded daily with full gauge reporting

Invoicing

Invoices generated directly from verified transaction data

Daily Stock Proration

Automatic proration of stock across products and OMCs

Pigging Records

Line pigging operations logged and tracked in-system

Full Terminal Reporting

All terminal-related operations documented in one place

Flexible for Management. Accountable by Design.

Full editability, backed by a complete audit trail

Management-Level Flexibility

Senior management can update any record when business needs demand it — TMS never blocks legitimate authority.

Nothing is invisible: every change is captured in a permanent, time-stamped audit log — so flexibility never becomes uncertainty.

Role-Based Access

Designation-wise permissions across the Terminal portal ensure each user sees and does only what their role allows.

One System. Every Drop Accounted For.

TMS brings vessel planning, gate operations, stock control, reconciliation and reporting onto a single, auditable platform — built for the realities of oil terminal operations.

INDUSTRONICS ENGINEERING

Let's talk about bringing TMS to your terminal.
